# List of Figures

1	3D figure of the orbit trajectory	5
2	2D figure of the position over time	5
3	Thrust acceleration components and total thrust acceleration over time	6
1	Total Au over time	6

### 1 Given

$$T_1 = 100 \, [min] = 6 \cdot 10^3 \, [sec]$$
  $T_2 = T_1 = 6 \cdot 10^3 \, [sec]$   $e_1 = 0$   $e_2 = 0$   $a_1 = \sqrt[3]{\frac{\mu T_1^2}{4\pi^2}} = 7.1366 \cdot 10^3 \, [km]$   $a_2 = a_1 = 7.1366 \cdot 10^3 \, [km]$   $\alpha = \Delta i = 0.01^\circ$ 

In CW frame with origin at Satellite #1 and at t = 0:

$$\begin{pmatrix} x_2(0) = 0 \\ y_2(0) = -1 \\ z_2(0) = 1 \end{pmatrix} [\text{km}] \qquad \begin{pmatrix} \dot{x}_2(0) = 0 \\ \dot{y}_2(0) = 0 \\ \dot{z}_2(0) = -0.74267 \cdot n \end{pmatrix} \begin{bmatrix} \frac{\text{km}}{\text{sec}} \end{bmatrix}$$

#### 1.1 Desired

$$\begin{pmatrix} x_2(t_f) = 0 \\ y_2(t_f) = 0 \\ z_2(t_f) = 0 \end{pmatrix} \qquad \begin{pmatrix} \dot{x}_2(t_f) = 0 \\ \dot{y}_2(t_f) = 0 \\ \dot{z}_2(t_f) = 0 \end{pmatrix}$$

#### 1.2 Limitations

The engine can't create trust in the x direction and:

$$a_{\text{max}} = 8 \cdot 10^{-6} \left[ \frac{\text{km}}{\text{sec}^2} \right]$$

### 2 The CW equations

$$\begin{cases} \ddot{x} - 2n\dot{y} - 3n^2x = f_x \\ \ddot{y} + 2n\dot{x} = f_y \\ \ddot{z} + n^2z = f_z \end{cases}$$
 (1)

 $2.1 \quad x-y$ 

$$\vec{x} = \begin{pmatrix} x \\ \dot{x} \\ y \\ \dot{y} \end{pmatrix} \tag{2}$$

$$\dot{\vec{x}} = F\vec{x} + G\vec{f} \tag{3}$$

Where:

$$F = \begin{pmatrix} 0 & 1 & 0 & 0 \\ 3n^2 & 0 & 0 & 2n \\ 0 & 0 & 0 & 1 \\ 0 & -2n & 0 & 0 \end{pmatrix} \qquad G = \begin{pmatrix} 0 & 0 \\ 1 & 0 \\ 0 & 0 \\ 0 & 1 \end{pmatrix} \qquad f = \begin{pmatrix} f_x \\ f_y \end{pmatrix} \tag{4}$$

2.2 z

$$\vec{x} = \begin{pmatrix} z \\ \dot{z} \end{pmatrix} \tag{5}$$

$$\dot{\vec{x}} = F\vec{x} + Gf \tag{6}$$

Where:

$$F = \begin{pmatrix} 0 & 1 \\ -n^2 & 0 \end{pmatrix} \qquad G = \begin{pmatrix} 0 \\ 1 \end{pmatrix} \qquad f = (f_z) \tag{7}$$

#### 2.3 x-y-z

The equations of motion in state space form are therefor:

$$\vec{x} = \begin{pmatrix} x \\ \dot{x} \\ y \\ \dot{y} \\ z \\ \dot{z} \end{pmatrix} \tag{8}$$

$$\dot{\vec{x}} = F\vec{x} + G\vec{f} \tag{9}$$

Where:

## 3 case A

The desired maneuver time is 2000 [sec]. The desired approach trajectory is a straight line with constant velocity from the initial point to the origin.

From geometric considerations, the required velocity on the straight line is:

$$\frac{\dot{\vec{x}}_{req}}{\dot{\vec{x}}_{req}} = \begin{pmatrix} \frac{x_f - x_0}{t_f} \\ \frac{y_f - y_0}{t_f} \\ \frac{z_f - z_0}{t_f} \end{pmatrix} = \begin{pmatrix} 0 \\ 5 \\ -5 \end{pmatrix} \cdot 10^{-4} \begin{bmatrix} \frac{\text{km}}{\text{sec}^2} \end{bmatrix}$$
(11)

Which mean that the initial pulse:

$$\Delta v_1 = \dot{\vec{x}}_{req} - \dot{\vec{x}}_0 = \begin{pmatrix} 0\\ 0.5\\ 0.2777 \end{pmatrix} \cdot 10^{-3} \left[ \frac{\text{km}}{\text{sec}^2} \right]$$
 (12)

and the final pulse:

$$\Delta v_f = \dot{\vec{x}}_f - \dot{\vec{x}}_{req} = \begin{pmatrix} 0 \\ -5 \\ 5 \end{pmatrix} \cdot 10^{-4} \left[ \frac{\text{km}}{\text{sec}^2} \right]$$
 (13)

Since the velocity is constant:

$$\begin{pmatrix} \ddot{x} \\ \ddot{y} \\ \ddot{z} \end{pmatrix} = \bar{0}$$

By substituting the constraints in the CW equations we get:

$$\begin{cases}
0 - 2n\dot{y} = f_x \\
0 = f_y \\
0 + n^2 z = f_z
\end{cases}$$
(14)

$$\vec{a} = \vec{f} = \begin{pmatrix} -2n \cdot 0.5 \cdot 10^{-3} \\ 0 \\ n^2 z \end{pmatrix}$$
 (15)

Check that the maximum acceleration hasn't been reached:

$$|\vec{a}| = \sqrt{(2n \cdot 0.5 \cdot 10^{-3}) + (n^2 z)} < \sqrt{(2n \cdot 0.5 \cdot 10^{-3}) + (n^2 \cdot 1)}$$

$$|\vec{a}| < 1.5163 \cdot 10^{-6} < 8 \cdot 10^{-6} \qquad \checkmark$$
(16)

By solving this system numerically, we obtain the approach trajectory.
